- Chapter 1 The building blocks
 - 1.1 Calculating portfolio weights when component values are given
 - 1.2 The weights of an equally weighted portfolio
 - 1.3 The weights of a market capitalization weighted portfolio
 - 1.4 Calculation of portfolio returns
 - 1.5 From simple to gross and multi-period returns
 - 1.6 The asymmetric impact of gains and losses
 - 1.8 The time series of asset returns
 - 1.9 The time series of portfolio returns
 - 1.10 The time series of weights
- Chapter 2 Analyzing performance
 - 2.1 Exploring the monthly S&P 500 returns
 - 2.2 The monthly mean and volatility
 - 2.3 Excess returns and the portfolio's Sharpe ratio
 - 2.4 Annualized mean and volatility
 - 2.5 Effect of window length choice
 - 2.6 Rolling annualized mean and volatility
 - 2.7 Subperiod performance analysis and the function window
 - 2.8 Balancing risk and reward
 - 2.9 Detecting non-normality using skewness and kurtosis
 - 2.10 Downside risk measures
 - 2.11 Drawdowns due to buying high, selling low
- Chapter 3 Performance drivers
 - 3.1 Driver 1: The assets' individual performance
 - 3.2 Driver 2: The choice of portfolio weights
 - 3.3 Driver 3: The correlation between the asset returns
 - 3.4 Interpreting correlation
 - 3.5 Making a risk-reward scatter diagram
 - 3.6 The covariance matrix
 - 3.7 Matrix-based calculation of portfolio mean and variance
 - 3.8 Who did it?
- Chapter 4 Optimizing the portfolio
 - 4.1 Exploring monthly returns of the 30 DJIA stocks
 - 4.2 Finding the mean-variance efficient portfolio
 - 4.3 Effect of the return target
 - 4.4 Imposing weight constraints
 - 4.5 Computing the efficient frontier using a grid of target returns
 - 4.6 Interpreting the efficient frontier
 - 4.7 Properties of the efficient frontier
 - 4.8 The minimum variance and maximum Sharpe ratio portfolio
